

In an information-driven environment it is key to have resources that are reliable around the clock. Display walls enable you to quickly reference information so you can make decisions quickly and efficiently. At Spinitar, we can recommend, design, install and support cutting-edge display solutions that are conducive to your environment. Our custom systems provide you with a wide range of application choices.

### **Command and Control Rooms**

Our visual specialists can seamlessly link multiple sources of data into a controllable and usable high-resolution visual format that can be displayed and positioned at any size by multiple operators 24/7. Designed with SCADA and EMS network topologies in mind, displays can span this data across multiple screens without loss of information. For additional security and performance, display walls and controllers have built-in redundancy features for continuous operation.

### **Security and Surveillance**

The global awareness and importance of security and surveillance systems has reached epic proportions in business and our everyday lives. Spinitar's display wall solutions offer 24/7 reliability and confidence. Their high-resolution and flexibility enable you to simultaneously show multiple real time images and share information that is vital for the security and safety of your application and operations.

### **Transportation Management**

Spinitar's management systems enable users to monitor, control, manipulate and improve land, air and sea conditions. They provide the ability to display large amounts of video feeds and detailed graphics from Intelligent Transportation Systems seamlessly throughout the entire display wall. We use displays that are engineered to provide a low cost of ownership by incorporating long life lamps and automatic color calibration.

## Utilities

Utility management centers require reliable and resourceful systems that enable easy monitoring with the ability to control, manage, and share a variety of critical information. Spinitar's seamless matrix of displays makes certain that no gray areas exist or content is lost from one screen to another within mapping or grid viewing. In addition, our high-definition and high-resolution displays have automatic calibration, self diagnostics and lamp redundancy for easy maintenance.

## Broadcasting

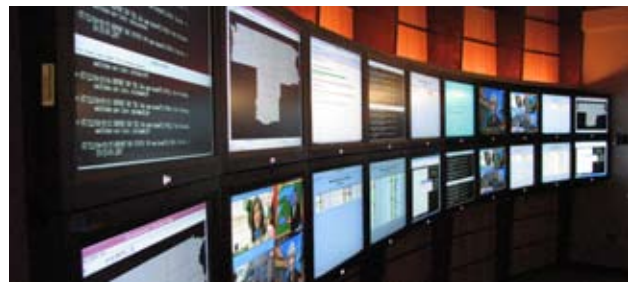

Spinitar offers display wall solutions specifically designed for the high performance and reliability required in the broadcast environment. Our display walls provide the flexibility to show multiple high-resolution images in a variety of formats without losing quality or content. Built in redundancy features in all our systems ensure continuous operation eliminating down time.

## Public Spaces

Spinitar's display walls incorporate extremely low maintenance, a space saving design and high brightness to combat tough ambient lighting conditions. Spinitar also utilizes automatic calibration technologies to provide easy maintenance for onsite staff. For limited space environments, we can implement displays that are fully enclosed with front access service, providing bright colorful images with high viewing angles.

## LED Walls

For a more rugged solution that can sustain different elements, there are LED display solutions. LED's come in outdoor, indoor, or multifunctional application types that can illustrate text, graphics or video in a high-resolution, bright, full-color format. Unequaled in brightness and contrast levels, LED displays add interest and immediacy to your communications.
